

Final QC / QC Check

Score and grade devices after repair. Pass devices to Ready to Sale or route failures back to the appropriate repair stage.

Step 1: Open the QC Queue

- Go to Quality -> QC Check from the left navigation.
- The list shows all devices awaiting QC with their fail count and previous QC history.
- Click 'Verify QC' next to the device you want to inspect.

Step 2: Score the Device (0 to 10 per category)

- Battery Score (0-10): based on battery health % and real-world performance.
- Screen Score (0-10): based on screen defects found during this QC check.
- Keyboard Score (0-10): based on key function and cosmetic condition.
- Body Score (0-10): based on panel condition across all four panels.
- The system calculates the total score automatically.

Step 3: Grade Formula

- Total score 85 or above: Grade A.
- Total score 70 to 84: Grade B.
- Total score 50 to 69: Grade C.
- Total score above 0 but below 50: Grade D (flag for review).
- The grade set here overrides the IQC grade for the Ready to Sale listing.

Step 4: Set the Result and Route the Device

- Result: select Pass or Fail. This is the authoritative QC decision.
- Issues Found: describe any defects observed during this QC check.
- Notes: add any additional observations or recommendations.
- On Fail, select where to send the device: L1 / L2 / L3.
- On Pass, the device moves to Ready to Sale (or Cosmetic pipeline if cosmetic work is needed).

Step 5: Spec Corrections and Stress Test

- If IQC specs were wrong, update Make, Model, CPU, Generation, or RAM directly on this form.
- Check the Stress Test result tab before finalising the QC decision.
- A third consecutive fail triggers a system recommendation to scrap the device.

Tips & Best Practices

- * Use the 'Verify QC' button to open the form -- the old label was 'QC'.
- * For Grade B or C devices, consider sending to the Cosmetic pipeline before marking as Pass.
- * Check Stress Test results before scoring -- stress test failures affect the QC decision.
- * A third consecutive QC fail generates an automatic scrap recommendation.
